AISHAH Specialist Clinic

HIFU lifting and facial countouring (High-Intensity Focused Ultrasound) is better than laser treatments as there is no visible redness or scaring with zero down time. It has become one of the most sought after non-invasive procedures for skin lifting and tightening for face and neck. Results are seen best after a week or two as the body stimulates natural collagen production.

PRP – (Platelet-rich Plasma) therapy is a process whereby blood is drawn from the body similar to a blood test and then placed in a machine that separates the blood cells, platelets and serum. This is then re-injected onto the area of the body that requires treatment. The platelets help the body to repair itself by releasing growth factors, stimulating the skin cells to generate new tissues, in addition to improving skin tone as well as collagen production.

Sports injury - PRP has potential effectiveness in the treatment of sports injuries. Elite athletes have credited PRP for its fast healing from sprained knees and chronic tendon injuries and being able to return to sports. These types of conditions have typically been treated with medications, physical therapy, or even surgery.

Terms and Conditions

- Advance booking at minimum of 24 hours in advance is required. Confirmation is subjected to availability
